

Flight Data Link

FLIGHT DATA LINK unleashes the power of full flight data for airline functions, beyond flight safety, through integration with enterprise data sources in a secure, authorized way. Flight Data Link brings time-series flight data from GE Digital's Event Measurement System (EMS) into Teradata's Vantage platform. Customers can then utilize the power of Vantage to provide flight analytics for teams outside of the flight safety team (i.e. engineering, maintenance, fuel, and loyalty).

Analysis of multiple flights and routes across fleets to help you to improve efficiencies and lower costs

Flexible environment for integration with other data sources and the use of any BI tool or language

Data ownership and management remains with the Flight Safety team

Flight Data Link allows Flight Safety teams to easily provide flight data to other teams across an airline for their analytical purposes. The solution automates this flow of valuable flight data while still providing governance for the Flight Safety team.

- Ability to visualize and share FOQA data outside of Safety Teams
- Better management of maintenance activities and the supply chain
- Help improve customer satisfaction through flight data

Product Benefits

Utilize near-real time flight data for predictive maintenance

Help to drive greater efficiency in operations and reduce costs by managing flights and assets better

Integrate supply chain data into maintenance planning and events
